Is your hard drive filling up with paper models found online? Don't just download them, build them!

The **IPMC:2013** atomic-powered automaton will help you put them together. This machine features state-of-the art tape memory and internal endless-feed cardstock output, self-sharpening cutting blades and onboard adhesive reservoir as well as solid-state components and dual tractor-tread drive train, so you'll be able to finish off your entire stockpile of paper model kits in no time flat.

After you've finished them, why not display your paper creations at the **International Paper Modelers Convention**, held on October 26, 2013 in Sterling, Virginia. Reserve your table now!
